GT911 Programming Guide

Applicable to firmware V1040 or later

Rev.10

2017-07-26

Contents

1. I²C Interface

GT911 interfaces with the host via 6 pins: VDD, GND, SCL, SDA, INT and RESET.

The INT pin of the host can be rising/falling-edge triggered. In addition, when INT is set as input, the host should leave it floating, with no internal pull-up or pull-down; the host controls the RESET pin of GT911 by driving it high or low. To ensure reliable reset, it is recommended that RESET pin outputs low for longer than 100 μs.

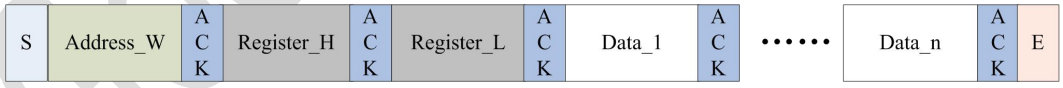
GT911 communicates with the host via standard I²C interface, with a maximum transmission rate of 400K bps. When the host communicates at rates exceeding 200K bps, it is required to pay special attention to the resistance of the external pull-up resistor of I²C interface to ensure the rise time and fall time of SCL and SDA signals comply with the requirements specified in GT911 datasheet. GT911 invariably serves as slave device in communication and its I²C slave address consists of 7 address bits and 1 Read/Write control bit. The high-order 7 bits are slave address while bit 0 is Read/Write control bit. GT911 supports two slave device addresses which are shown below:

7-Bit Address	8-Bit Write Address	8-Bit Read Address
0x5D	0xBA	0xBB
0x14	0x28	0x29

Upon each power-on or reset, it is required to select I²C address using INT pin. For detailed timings, please refer to section 4.1 and section 4.2.

2. I²C Timings

2.1 Timing for Write Operation



S: Start condition.

Address_W: Slave address with Write control bit.

ACK: Acknowledgement signal.

Register_H, Register_L: 16-bit register address where Write operation starts

Data_1 to Data_n: Data bytes 1-n.

E: Stop condition.

After setting the start address for Write operation, it is allowed to write one or more bytes at a time. GT911 will automatically update the address pointer and store the data bytes in sequence.

2.2 Timing for Read Operation

First, set address pointer based on the aforesaid Wirte Operation timing sequence. Then, resend Start condition to perform Read addressing and read data.

Address_R: Slave address with Read control bit.

NACK: Host issues NACK after reading the last byte.

After setting address pointer, the host can read one or more than one byte at a time. GT911 will automatically update the address pointer and send subsequent data in sequence.

The Stop condition (the first E signal as shown in the above diagram) after setting the address pointer is optional. However, the repeated Start condition has to be sent.

3. Register Map

3.1 Real-time Command Registers (Write only)

Addr	Name	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x8040	Command	0: Read coordinates status; 2: Read diff data or raw data; 4: Baseline calibration (Internal test); 6: Enter Charge mode; 8 : Gesture mode. 0x20: Enter HotKnot Slave Approach mode 0x21: Enter HotKnot Master Approach mode 0x22: Enter data transmission mode 0x28: Exit Slave Approach mode 0x29: Exit Master Approach mode 0x2A: Exit data transmission mode 0xAA: Used by ESD protection mechanism; driver reads 0x8040 and checks the value of 0x8040, then writes 0xAA to 0x8040 periodically; other values are invalid.				1: Read diff data or raw data; 3: Baseline update (Internal test); 5: Screen off; 7: Exit Charge mode			
0x8041	ESD_Check	Used by ESD protection mechanism; reset to 0 upon initialization; after that, driver writes 0xAA to 0x8041 once only, and then reads 0x8041 and checks the value at 0x8041 periodically.							
0x8046	Command_Che	For commands greater than 0x07, it is required to write the command to 0x8046							

	ck	before to 0x8040, to improve ESD immunity.

3.2 Configuration Registers (R/W)

Register	Config Data	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x8047	Config_ Version	The version number of configuration file (configuration parameters will be updated only when the version number of the new release is later than that of the existing one, or equal to that of the existing one but there are changes in contents; configuration file is numbered sequentially from 'A' to 'Z'; Send 0x00 and the version number will be reset to 'A')							
0x8048	X Output Max (Low Byte)	Resolution of X axis							
0x8049	X Output Max (High Byte)								
0x804A	Y Output Max (Low Byte)	Resolution of Y axis							
0x804B	Y Output Max (High Byte)								
0x804C	Touch Number	Reserved				Fingers supported: 1 to 5			
0x804D	Module_ Switch1	Driver_ Reversal (Y2Y)	Sensor_ Reversal (X2X)	Stretch_rank		X2Y (X,Y axes exchan-ge)	Sito (noise mitigati-on by softwar e)	INT triggering mechanism 00: Rising edge 01: Falling edge 02: Low level 03: High level	
0x804E	Module_ switch2	Reserved		FirstFilt er_Dis	Reserved		Approc h_En	HotKn ot _En	Touch_ Key
0x804F	Shake_Count	De-jitter count for touch-up				De-jitter count for touch-down			
0x8050	Filter	First_Filter		Normal_Filter (Filtered delta between the last reported coordinate and the coordinate to be reported; coefficient is 4)					
0x8051	Large_Touch	Number of nodes within one palm touch							
0x8052	Noise_ Reduction	Reserved				Noise decrement (0-15 valid, coefficient is 1)			
0x8053	Screen_ Touch_Level	Touch Threshold on screen							
0x8054	Screen_ Leave_Level	Release Threshold on screen							
0x8055	Low_Power_ Control	Reserved				No-touch duration for entering lower power mode (0s to 15s)			
0x8056	Refresh_Rate	Pulse width setting in gesture mode				Report rate (period: 5+N ms)			
0x8057	x_threshold	X position delta threshold for coordinate to be reported: 0-255 (coefficient: 1; based on the reported resolution.) If set to 0, GT911 will keep outputting coordinates							

		continuously when touch is present.			
0x8058	y_threshold	Y position delta threshold for coordinate to be reported: 0-255 (coefficient: 1; based on the reported resolution.) If set to 0, GT911 will keep outputting coordinates continuously when touch is present			
0x8059	X_Speed_Limit	Reserved			
0x805A	Y_Speed_Limit				
0x805B	Space	Blank space of top border (coefficient: 32)		Blank space of bottom border (coefficient: 32)	
0x805C		Blank space of left border (coefficient: 32)		Blank space of right border (coefficient: 32)	
0x805D	Mini_Filter	Reserved		Mini filter configuration during line drawing process; this field configured to 0 indicates 4.	
0x805E	Stretch_R0	Coefficient of Stretch zone 1			
0x805F	Stretch_R1	Coefficient of Stretch zone 2			
0x8060	Stretch_R2	Coefficient of Stretch zone 3			
0x8061	Stretch_RM	The base value of the stretch zones			
0x8062	Drv_GroupA_Num	All_Driving	Reserved	Driver_Group_A_number	
0x8063	Drv_GroupB_Num	Reserved		Driver_Group_B_number	
0x8064	Sensor_Num	Sensor_Group_B_Number		Sensor_Group_A_Number	
0x8065	FreqA_factor	Driving Frequency Multiplication Factor of Driver Group A GroupA_Frequency = Multiplication Factor * Fundamental Frequency			
0x8066	FreqB_factor	Driving Frequency Multiplication Factor of Driver Group B GroupB_Frequency = Multiplication Factor * Fundamental Frequency			
0x8067	Pannel_BitFreqL	Fundamental Frequency of Driver Groups A and B (1526HZ< Fundamental Frequency <14600Hz)			
0x8068	Pannel_BitFreqH				
0x8069	Pannel_Sensor_TimeL	Time interval between adjacent two Drive signals (unit: us); Reserved (used in beta version; invalid in a Release)			
0x806A	Pannel_Sensor_TimeH				
0x806B	Pannel_Tx_Gain	Reserved		Pannel_Drv_output_R 4 gain levels, configurable	Pannel_DAC_Gain 0: Gain max. 7: Gain min.
0x806C	Pannel_Rx_Gain	Pannel_PGA_C	Pannel_PGA_R	Pannel_Rx_Vcmi (4 gain levels, configurable)	Pannel_PGA_Gain (8 gain levels, configurable)

0x806D	Pannel_Dump_Shift	Magnification factor of raw data in Gesture Mode (2^N)				Magnification factor of raw data (2^N)			
0x806E	Drv_Frame_Control	Reserved	SubFrame_DrvNum (maximum setting is 17)						Repeat_Num (Accumulative sampling count)
0x806F	Charging_Level_Up	After the host issues Charge command, IC enters Charge mode and raises the Touch_Level and Leave_Level. The level in Charge mode= original level + configured value. When configured value is 0, the level in Charge mode equals to the original level.							
0x8070	Module_Switch3	Reserved	Gesture_Hop_Dis	Strong_Smooth	Reserved				Shape_En
0x8071	GESTURE_DIS	Distance threshold for a Y-direction swipe (up/down) gesture to be valid				Distance threshold for X-direction swipe (left/right) gesture to be valid			
0x8072	Gesture_Long_Press_Time	Timeout setting for touch-and-hold gesture to be invalid; IC enters Green mode again							
0x8073	X/Y_Slope_Adjust	The adjustment amount of X-direction slope when using “four point trigonometric approximation algorithm” to calculate the coordinates (0: algorithm disabled)				The adjustment amount of Y-direction slope when using “four point trigonometric approximation algorithm” to calculate the coordinates (0: algorithm disabled)			
0x8074	Gesture_Control	Maximum time interval between the two taps of a double-tap gesture (unit:100ms, defaults to 1.5s when configured as 0)				GestureDrv_PGA_Gain (8 gain levels, configurable)			
0x8075	Gesture_Switch1	Swipe left	Swipe up	Swipe right	w	o	m	e	c
0x8076	Gesture_Switch2	Swipe is valid only at the last Tx (located at the bottom of touch screen)	z	s	^	>	V	Double-tap	Swipe down
0x8077	Gesture_Refresh_Rate	Report rate in Gesture mode (period is 5+ms)							
0x8078	Gesture_Touch_Level	Touch threshold in Gesture mode							
0x8079	NewGreenWakeUpLevel	Threshold to wake up GT911 after it enters NewGreen mode							

0x807A	Freq_Hopping_Start	Start frequency for frequency hopping (when Range_Ext=0, the unit is 2KHz, for example, 50 indicates100KHz; When Range_Ext=1, the unit is BitFreq)				
0x807B	Freq_Hopping_End	End frequency for frequency hopping (when Range_Ext=0, the unit is 2KHz, for example, 150 indicates 300KHz; when Range_Ext=1, the unit is BitFreq)				
0x807C	Noise_Detect_Times	Detect_Stay_Times (Number of measurements taken on each frequency in each noise detection; 2 is recommended)		Detect_Confirm_Times (Noise detection count for noise value confirmation, 1-63 valid; recommended setting is 20)		
0x807D	Hopping_Flag	Hopping_En	Range_Ext	Dis_Force_Ref	Delay_Hopping	Reserved
0x807E	Hopping_Threshold	Fast_Hopping_Limit: Fast hopping is enabled only when the interference of current frequency is greater than Fast_Hopping_Limit*4. The minimum setting is 5.			Hopping_Hit_Threshold (Optimal frequency threshold: Current operating frequency interference- Minimum interference>Configured valuex4, then optimal frequency is selected and frequency hopping will be implemented)	
0x807F	NC	Reserved				
0x8080	Noise_Min_Threshold	When the minimum interference caused by ESD is greater than the threshold, it will initiate fast attenuation processing. Setting this field to 0 indicates this function is disabled and setting it to a big value (such as 200 or greater) has the equivalent effect. To enable this function, it is recommended to set this value 5 to 20 higher than the interference of the lowest frequency (LCD interference and common-mode interference, whichever is greater).				
0x8081	NC	Reserved				
0x8082	Hopping_Sensor_Group	The number of Rx channel groups in Hopping Frequency Noise Detection (4 groups recommended)				
0x8083	Hopping_seg1_Normalize	Seg1 Normalize coefficient (sampled value *N / 128= Raw data)				
0x8084	Hopping_seg1_Factor	Seg1 Center frequency factor				
0x8085	Main_Clock_Ajdust	Fine adjustment to IC clock speed, acceptable range : -7 to +8				
0x8086	Hopping_seg2_Normalize	Seg2 Normalize coefficient (sampled value *N / 128= Raw data)				
0x8087	Hopping_seg2_Factor	Seg2 Center frequency factor				

0x8088	NC	Reserved	
0x8089	Hopping_seg3_Normalize	Seg3 Normalize coefficient (sampled value *N / 128= Raw data)	
0x808A	Hopping_seg3_Factor	Seg3 Center frequency factor	
0x808B	NC	Reserved	
0x808C	Hopping_seg4_Normalize	Seg4 Normalize coefficient (sampled value *N / 128= Raw data)	
0x808D	Hopping_seg4_Factor	Seg4 Center frequency factor	
0x808E	NC	Reserved	
0x808F	Hopping_seg5_Normalize	Seg5 Normalize coefficient (sampled value *N / 128= Raw data)	
0x8090	Hopping_seg5_Factor	Seg5 Center frequency factor	
0x8091	NC	Reserved	
0x8092	Hopping_seg6_Normalize	Seg6 Normalize coefficient (sampled value *N / 128= Raw data)	
0x8093	Key 1	Key 1 position: 0-255 valid (0 indicates no key is available. When the values of these four registers for keys are multiples of 8, it indicates independent key design manner.)	
0x8094	Key 2	Key 2 position: 0-255 valid (0 indicates no key is available. When the values of these four registers for keys are multiples of 8, it indicates independent key design manner)	
0x8095	Key 3	Key 3 position: 0-255 valid (0 indicates no key is available. When the values of these four registers for keys are multiples of 8, it indicates independent key design manner)	
0x8096	Key 4	Key 4 position: 0-255 valid (0 indicates no key is available. When the values of these four registers for keys are multiples of 8, it indicates independent key design manner)	
0x8097	Key_Area	Touch-and-Hold duration threshold to trigger baseline update (1s to 16s).	Key active area configuration (single side): 0-15 valid
0x8098	Key_Touch_Level	Touch threshold on touch key	
0x8099	Key_Leave_Level	Release threshold on touch key	
0x809A	Key_Sens	KeySens_1 (sensitivity coefficient of Key 1)	KeySens_2 (sensitivity coefficient of Key 2)
0x809B	Key_Sens	KeySens_3 (sensitivity coefficient of Key 3)	KeySens_4 (sensitivity coefficient of Key 4)

0x809C	Key_Restrain	The key-suppressed duration after finger leaves screen (unit: 100ms); 0 means the key-suppressed duration is 600ms.					Adjacent independent key suppression parameter	
0x809D	Key_Restrain_ Time	Reserved					Key-suppressed duration after the finger slides to leave from the bottom of the screen (unit: 100 ms). Timing starts from the moment that finger leaves the screen. If there is touch key event within this period, the touch key will be suppressed until the touch key is released and touched down again. (if set to 0, this function is disabled)	
0x809E	GESTURE_ LARGE_TOUCH	Palm suppression in Gesture mode. If set to 0, this function is disabled.						
0x809F	NC	Reserved						
0x80A0	NC	Reserved						
0x80A1	Hotknot_Noise_ Map	Reserved	200K	250K	300K	350K	400K	450K
0x80A2	Link_Threshold	Link_NoiseThreshold (Absolute threshold to start HotKnot data transmission)						
0x80A3	Pxy_Threshold	Pxy_NoiseThreshold (Absolute threshold for another HotKnot terminal to be detected)						
0x80A4	GHot_Dump_ Shift	Reserved			Rx_Self	Magnification factor of raw data (2^N)		
0x80A5	GHot_Rx_Gain	PGA_C	PGA_R	Reserved		PGA_Gain (8 gain levels, configurable)		
0x80A6	Freq_Gain0	400K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			450K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			
0x80A7	Freq_Gain1	300K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			350K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			
0x80A8	Freq_Gain2	200K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			250K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			
0x80A9	Freq_Gain3	Reserved			150K signal gain adjustment, adjustment amount is N/8. Invalid when N=0.			
0x80AA	NC	Reserved						
0x80AB	NC	Reserved						
0x80AC	NC	Reserved						
0x80AD	NC	Reserved						
0x80AE	NC	Reserved						
0x80AF	NC	Reserved						
0x80B0	NC	Reserved						
0x80B1	NC	Reserved						
0x80B2	NC	Reserved						
0x80B3	Combine_Dis	Distance for adjacent touch points to be combined in Gesture mode			Distance for adjacent touch points to be combined in non-gesture modes			

0x80B4	Split_Set	Distance for adjacent touch points caused by a palm touch to be separated	Distance for adjacent touch points caused by a normal-size touch to be separated
0x80B5	NC	Reserved	
0x80B6	NC	Reserved	
0x80B7 to 0x80C4	Sensor_CH0 to Sensor_CH13	Channel number on chip corresponding to ITO Rx channel number on touch sensor	
0x80C5 to 0x80D4	NC	Reserved	
0x80D5 to 0x80EE	Driver_CH0 to Driver_CH25	Channel number on chip corresponding to ITO Tx channel number on touch sensor	
0x80EF to 0x80FE	NC	Reserved	
0x80FF	Config_Chksum	Configuration checksum (calculated over bytes 0x8047 through 0x80FE)	
0x8100	Config_Fresh	Configuration updated flag (the flag is written by the host)	

Supplementary description on some registers:

[0x804D] Module_Switch1

Bit7: Driver_Reversal(Y2Y), configured as 1 indicates Y axis reversal

Bit6: Sensor_Reversal(X2X), configured as 1 indicates X axis reversal.

Bit5-bit4: Stretch_rank, stretching method

00,01,02: Weak stretching coefficient, 0.4P

03: User-defined stretching coefficient

[0x804E] Module_Switch2

Bit5: FirstFilter_Dis: This bit decides whether to increase the de-jitter intensity on the first touch.

0: enabled; 1: disabled.

Bit2: Approch_En, Hotknot proximity detection enable bit

Bit1: HotKnot_En, Hotknot function enable bit.

[0x8056] Refresh_Rate

Bit7~Bit4: Pulse width setting for Gesture wakeup, unit: 250us. Setting to “f” indicates INT should be driven high if the host fails to read data.

[0x805B-0x805C] Space

Space indicates the blank space of the 4 borders of the touch screen, which is used to adjust the active area when the ITO grid exceeds the viewing area. 0-15 configurable (indicates cutting N×32 original coordinates) .0 indicates no cutting. The maximum cutting area width is 15×32=480 original coordinates (one Pitch consists of 512 original coordinates; if the cutting area width exceeds one Pitch, it is allowed to subtract one Pitch from the configuration directly.)

[0x8070] Module_Switch3

Bit6: Gesture_Hop_Dis, frequency hopping disable bit in Gesture Mode. Default setting is 0: Enable; Setting to 1: Disable.

Bit5: Strong_Smooth: 5-level mean value smoothing, default setting is 0 (disable). It is recommended not to enable this function unless the pitch is comparatively large and linearity is poor.

Bit0: Shape_En: Anti-bending algorithm enable bit. 1: Enable; 0: Disable.

[0x8071] GESTURE_DIS

Bit7~4: Distance for Y-direction swipe (up/down) gesture to be valid. The minimum valid swipe distance is the N/16 of the touch screen length. Setting to 0 indicates 8.

Bit3~0: Distance for X-direction swipe (left/right) gesture to be valid. The minimum valid swipe distance is the N/16 of the touch screen length. Setting to 0 indicates 5.

[0x807C] Noise_Detect_Times

Bit7~6: Detect_Stay_Times: Number of measurements taken on each frequency in each noise detection; recommended setting is 2.

Bit5~0: Detect_Confirm_Times: Noise detection count for noise value confirmation; recommended setting is 15-20.

[0x807D] Hopping_Flag

Bit7: Hopping_En, frequency hopping enable bit (1: Enable, 0: Disable).

Bit6: Range_Ext, frequency hopping range extension flag. For firmware V1040, please set to 1.

Bit5: Dis_Force_Ref. If set to 0: Update the baseline after frequency hopping;

If set to 1: Do not update the baseline after frequency hopping.

Bit4: Delay_Hopping. If set to 1: Frequency hopping occurs only after finger leaves the screen; This bit as 0 or Dis_Force_Ref configured to 1: Delay_Hopping is disabled.

Bit3~0: Detect_Time_Out is the timeout setting for noise detection. Unit: second.

[0x807E] Hopping_Threshold

Bit3~0: Hopping_Hit_Threshold, that is, optimal frequency threshold; when the interference of the current operating frequency －the minimum interference > configured value x4, then the optimal frequency is selected and frequency hopping will be implemented.

[0x809A-0x809B] Key_Sens

The sensitivity coefficient configuration of 4 independent touch keys, can be configured to 0-15 (16 grades in total). Higher grade indicates higher sensitivity. This is valid only for independent touch keys since node capacitance deviation that leads to touch key sensitivity inconsistency is more likely to happen in independent touch key design process.

[0x809C] Key_Restrain

Bit3~0: Adjacent independent key suppression threshold. When the second largest value > the largest value * Key_Restrain/16, no touch on touch key is reported. Recommended setting is 7±2.

[0x80A2] Data_Threshold

HotKnot technology uses frequency to indicate data. Two HotKnot terminals perform data transmission by issuing signals of specified frequency. Data_Threshold is a threshold to distinguish whether there is signal or not. When LCD is turned off and no signal is present, the white noise received by HotKnot terminal is within 5. It is recommended that the Data_Threshold should be 5 greater than the white noise and no less than 10.

[0x80A3] Pxy_Threshold

If the HotKnot proximity detection is enabled when LCD is on, employ differential algorithm to filter interference. The threshold is differential threshold. If the noise amplitude changes significantly, set the differential threshold to a larger value. The threshold can be adjusted according to the contact area and distance between two hotknot terminals. It is suggested that this threshold be greater than 15; recommended setting is 20.

[0x80A4] Dump_Shift

The Dump_Shift is used to magnify the HotKnot raw data. Normal configuration is 2-4.

[0x80A5] Rx_Gain

Rx_Gain is used for hardware setting in HotKnot receive mode. The mechanism is the same as that of Rx_Gain configuration on touch panel.

[0x80A6-0x80A9] Freq_Gain0~3

Software gain coefficient of HotKnot signals. The 7 frequencies used by HotKnot are ranged from 150KHz to 450KHz; one step is 50KHz. Adjust the software gain according to the actual sampled raw data of frequencies to improve the data uniformity and minimize the signal diversity between different frequencies.

[0x80B3] Combine_Dis

Bit7~4: Distance for adjacent touch points to be combined in Gesture mode, 0 to 15 configurable; Combine distance=Sqrt (Configured value * 2) pitch. For backward compatibility, 0 indicates the Combine distance is 2 pitches.

Bit3~0: Distance for adjacent touch points to be combined, 0 to 15 configurable; Combine distance=Sqrt (Configured value* 2) pitch. For backward compatibility, 0 indicates the Combine distance is 2 pitches.

[0x80B4] Split_Set

Bit7~4: Distance between adjacent touch points caused by a palm touch to be separated, 0 to 15 configurable; Separation distance= Sqrt (configured value *2) pitch. For backward compatibility, 0 indicates the Separation distance is Sqrt (12) pitch.

Bit3~0: Distance between adjacent touch points caused by a normal-size touch to be separated, 0 to 15 configurable; Separation distance=Sqrt (configured value *2) pitch. For backward compatibility, 0 indicates the Separation distance is Sqrt (7) pitch.

3.3 Coordinate Information Registers

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x8140	R	Product ID (first byte, ASCII)							
0x8141	R	Product ID (second byte, ASCII)							

0x8142	R	Product ID (third byte, ASCII)				
0x8143	R	Product ID (fourth byte, ASCII)				
0x8144	R	Firmware version (HEX. low byte)				
0x8145	R	Firmware version (HEX. high byte)				
0x8146	R	x coordinate resolution (low byte)				
0x8147	R	x coordinate resolution (high byte)				
0x8148	R	y coordinate resolution (low byte)				
0x8149	R	y coordinate resolution (high byte)				
0x814A	R	Vendor_id				
0x814B	R	Reserved				
0x814C	R	Reserved				
0x814D	R	Reserved				
0x814E	R/W	Buffer status	Large detect	Reserved	HaveKey	Number of touch points
0x814F	R	Track id				
0x8150	R	point 1 x coordinate (low byte)				
0x8151	R	point 1 x coordinate (high byte)				
0x8152	R	point 1 y coordinate (low byte)				
0x8153	R	point 1 y coordinate (high byte)				
0x8154	R	point 1 size (low byte)				
0x8155	R	point 1 size (high byte)				
0x8156	R	Reserved				
0x8157	R	track id				
0x8158	R	point 2 x coordinate (low byte)				
0x8159	R	point 2 x coordinate (high byte)				
0x815A	R	point 2 y coordinate (low byte)				
0x815B	R	point 2 y coordinate (high byte)				
0x815C	R	Point 2 size (low byte)				
0x815D	R	point 2 size (high byte)				
0x815E	R	Reserved				
0x815F	R	track id				
0x8160	R	point 3 x coordinate (low byte)				
0x8161	R	point 3 x coordinate (high byte)				
0x8162	R	point 3 y coordinate (low byte)				
0x8163	R	point 3 y coordinate (high byte)				
0x8164	R	point 3 size (low byte)				
0x8165	R	point 3 size (high byte)				
0x8166	R	Reserved				
0x8167	R	track id				
0x8168	R	point 4 x coordinate (low byte)				
0x8169	R	point 4 x coordinate (high byte)				
0x816A	R	point 4 y coordinate (low byte)				

0x816B	R	point 4 y coordinate (high byte)
0x816C	R	point 4 size (low byte)
0x816D	R	point 4 size (high byte)

Supplementary description on some registers:

[0x814A] Vendor_id

Vendor ID is codetermined by pins *sensor_opt1* and *sensor_opt2*. Different combinations of their connections can identify 6 Vendor IDs as shown below:

sensor_opt1	sensor_opt2	Vendor_id
GND	GND	0
VDDIO	GND	1
NC	GND	2
GND	300K	3
VDDIO	300K	4
NC	300K	5

[0x814E]:

Bit7: Buffer status. 1 = coordinate (or key) is ready for host to read; 0 = coordinate (or key) is not ready and data is not valid. After reading coordinates, host should write a “0” to this flag (or the entire byte) via I^2C.

Bit6: Large detect. 1 indicates there is palm touch on touch screen.

Bit4: HaveKey. 1: Touch is present on touch key; 0: Touch is released on touch key.

Bit3~0: Number of touch points on touch screen.

[0x819F]

When HotKnot proximity detection is enabled and another HotKnot terminal is detected, GT911 will report the detection result to the host in coordinates. Therefore, the Number of touch points will add 1. The track id of the added touch point is fixed to 32, and PxyOk is set to 1. Please note that the address of the added touch point is fixed to the address of the coordinates of the first touch point.

3.4 Gesture Information Registers

(Gesture Feature Registers: share the addresses with the coordinate information registers)

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x8140	R	Gesture ID (first Byte, ASCII G)							
0x8141	R	Gesture ID (second Byte, ASCII E)

3.5 Command status registers of GT911

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0x81A8	R	GT911_Status: 0x00: touch detection mode; 0x88: slave approach mode; 0x99: master approach mode; 0xAA: Receive mode; 0xBB: Send mode, indicates the Transmit Buffer is refreshed correctly.							
0x 81A9	R	GT911_Status_Bak: GT911_Status backup							

[0x81A8] GT911_Status

0x00: Indicates GT911 will only perform touch detection and no HotKnot-related operations will be implemented.

0x88: When HotKnot proximity detection function is enabled, the host sends command 0X20 to enable GT911 to enter slave approach mode (works as receiving terminal). In this mode, hotkont proximity detection and touch detection alternate. When successfully detect the transmitting terminal, GT911 will report the detection result to the host in coordinates (track id is 32). The host can issue command 0X28 to enable GT911 to exit slave approach mode.

0x99: When HotKnot proximity detection is enabled, the host sends command 0X21 to enable GT911 to enter master approach mode. In this mode, HotKnot proximity detection and touch detection alternate. When successfully detect the receiving terminal, GT911 will report the detection result to the host in coordinates (track id is 32). The host can issue command 0X29 to enable GT911 to exit master approach mode.

0xAA: When GT911 successfully detect another HotKnot terminal, the host sends the hotknot transmission firmware to GT911. While the firmware runs, GT911 enters Receive mode by default. In this mode, GT911 will not implement touch detection, and it will keep detecting data from the transmitting terminal. Once a data frame is received, GT911 will notify the host to process the data via INT.

0xBB: When GT911 successfully detect another hotknot terminal, the host sends the hotknot transmission firmware to GT911. While the firmware runs, GT911 enters Receive mode by default. In this mode, when the Transmit Buffer is refreshed correctly, GT911 switches to Send mode. When the data in the Transmit Buffer is transmitted successfully, GT911 will notify the host to process the data via INT. When data processing is completed, GT911 switches to Receive mode and perform Leave Detection, until the Transmit Buffer is correctly refreshed again.

When GT911 is implementing hotknot-related operations, the host can distinguish whether the previously-issued command is transmitted successfully and whether resending is needed, or decide which hotknot command to be sent by querying GT911_Status.

[0x81A9] GT911_Status_Bak

Backup of GT911_Status. It is suggested that the host reads the GT911_Status and GT911_Status_Bak simultaneously. Only when these two values are the same, can the status be considered valid, thus reducing the interference to I^2C bus which causes data errors.

3.6 Hotknot status registers

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0xAB10	R	SendStatus: Send status register							
0xAB11	R	RevStatus: Receive status register							
0xAB12	R	SendStatusBak: Send status register backup							
0xAB13	R	RevStatusBak: Receive status register backup							
…	R	NC (11 bytes reserved)							
0xAB1F	R/W	When there is event needs to be handled by the host, GT911 will write 0xAA to this address and notify the host to handle the event via INT. After handling the event, the host sends another command other than 0xAA. And GT911 will start to work again. Otherwise, it will wait for 2.5s before starting to work again.							

Supplementary description on some registers:

Data read from this field is valid only when GT9

1 operates in Receive Mode or Send Mode, that is to say, only when GT911_Status is 0xAA or 0xBB.

[0xAB10] SendStatus

This register indicates the Send status in Send Mode.

0x01: indicates GT911 is in idle state. When a data frame is transmitted successfully and there is no data needs to be sent, GT911 will automatically switch to Receive Mode and perform Leave Detection. The host sends the outgoing data to the HotKnot Transmit Buffer in this state.

0x02: indicates GT911 is transmitting data. The host cannot modify the data in the Transmit Buffer in this state.

0x03: all data in Transmit Buffer is transmitted successfully. GT911 notifies the host to process the data via INT. After reading the status, the host writes a number other than 0xAA to 0xAB1F, then GT911 will automatically switch to idle state and enter Receive Mode and perform Leave Detection.

0x04: The data sent by the host to the Transmit Buffer fails to pass the verification (incorrect or byte length does not match). GT911 notifies the host to handle via INT. After reading the status, the host writes a number other than 0xAA to 0xAB1F, and then resends the

previously-issued data again.

0x05: GT911 has finished transmitting a data frame but the transmission fails. Instead of notifying the host via INT, GT911 will resend the data frame automatically.

Please note that, if the transmission is unsuccessful, GT911 will not stop resending until the data is transmitted successfully. Therefore, a timeout setting by the host or Leave Detection is required to terminate the endless resending due to Send Failure.

0x07: GT911 has detected that the receiving terminal has left. After the host capturing this status, GT911 may exit Send mode. When transmitting a data frame successfully, GT911will enable Leave detection. GT911 can distinguish whether the receiving terminal exists or not by detecting the feedback signal on the frequency sweep signal sequence. If no feedback signal is detected for 1 second, it is regarded that the receiving terminal has left.

[0xAB11] RevStatus

This register indicates the Receive status in Receive Mode.

0x01: indicates GT911 is in idle state. It is detecting data from the transmitting terminal but no valid signal has been detected yet.

0x02: indicates GT911 has detected the start signal and is receiving data.

0x03: indicates GT911 has received a data frame successfully and has sent it to the Receive Buffer. GT911 will notify the host to process the data via INT. After reading the data in Receive Buffer, the host has to write a number other than AA to 0xAB1F.

0x04: indicates GT911 has received a data frame but does not pass the CRC16 verification. Instead of notifying the host to handle via INT, GT911 will automatically detect the start signal again.

Please note that if the CRC verification fails or an overlong void signal is received, it will not stop detecting the start signal until the data frame is received successfully. Therefore, a timeout setting by the host is required to terminate the endless start signal detection due to Receive Failure.

0x07: GT911 detected that the transmitting terminal has left. After the host capturing this status, GT911 may exit receive mode. When receiving a data frame successfully, GT911 will start Leave detection. GT911 can distinguish whether the transmitting terminal exists or not by

detecting the frequency sweep signal sequence sent by the transmitting terminal. If no signal is detected for 1s, it is regarded that the transmitting terminal has left.

[0xAB12] SendStatusBak

Backup for SendStatus. Before GT911 notifies the host via INT, SendStatus will assign the value to SendStatusBak. The SendStatus is valid only when the host reads the same value in SendStatus and SendStatusBak. If the values are different, the host will read the values again 2ms later, thus improving the ESD immunity.

[0xAB13] RevStatusBak

Backup for SendStatus. Before GT911 notifies the host via INT, RevStatus will assign the value to RevStatusBak. The RevStatus is valid only when the host reads the same value in RevStatus and RevStatusBak. If the values are different, the host will read the values again 2ms later.

3.7 HotKnot Transmit Buffer

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0xAC90	W	DataLength: valid data length , <129 bytes							
0x AC91	W	Data0							
0xAC92	W	Data1							
…	W	…							
0xAD10	W	Data127							
0xAD11	W	CheckSum							
…	NC	Reserved							
0xAD91	W	Data_Fresh data updated flag (0xAA written by the host)							

Supplementary description on some registers:

This field can be written only when GT911 operates in Receive Mode, that is to say, GT911_Status is 0xAA. Otherwise, unpredictable results will occur.

[0xAC90] DataLength

The maximum capacity of a data frame supported by HotKnot is 128 Bytes; DataLength should not exceed 128 and must be even number.

[0xAD11] CheckSum

The address of CheckSum is not fixed. It stays behind the valid data. Checksum check starts

from 0xAC90. For example, if there are 2 data bytes, the address of Checksum is 0xAC93. The value is the complement of the sum.

[0xAD91] Data_Fresh

The host writes data to other addresses before writing 0xAA to 0xAD91(sets the Transmit Buffer refreshed flag); after GT911 finds the flag, it will check whether the data in the Transmit Buffer passes the verification. If the data passes the verification, GT911 will switch to Send Mode and start transmission immediately; if the data does not pass the verification, GT911 will notify the host to handle via INT.

3.8 Hotknot Receive Buffer

Addr	Access	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
0xAE10	R/W	buffer status							
0x AE11	R/W	DataLength valid data length , <129 bytes							
0xAE12	R	Data0: the first data byte							
0xAE13	R	Data1: the second data byte							
…	R	…							
0xAE91	R	Data127 : the 128th data byte							
0xAE92~ 0xAE93	R	Crc16Check data CRC16 verification. Please note that it should stay behind the data, not fixed to this address. big-endian mode							

Supplementary description on some registers:

Data in this field is valid only when GT911 operates in Receive Mode, GT911_Status is 0xAA, and RevStatus is 0x03.

[0xAE10]buffer status

bit7: buffer status as 1 indicates data in Receive Buffer is ready to be read.

[0x AE11]DataLength

Valid data length < 128 bytes.

[0xAE92~0xAE93] Crc16Check

Data CRC-CICTT verification, big-endian mode.

Instruction on CRC check mechanism:

As for data frame whose length is n, both the n data bytes and the data length will be checked.

For example: The data frame length is 112 bytes; the host needs to read 114 bytes (112 data

bytes+2 bytes CRC16 check) from the address 0xAE12. The host figures out the CRC of “112 data bytes+length”, and compares it with the CRC at (0xAE12+112). If the two CRCs are the same, the data passes verification; otherwise, verification fails. Please note that, the calculation of CRC and length is performed in the end of the process, not at the beginning.

Reference Code for Crc16 calculation (note: big-endian mode):

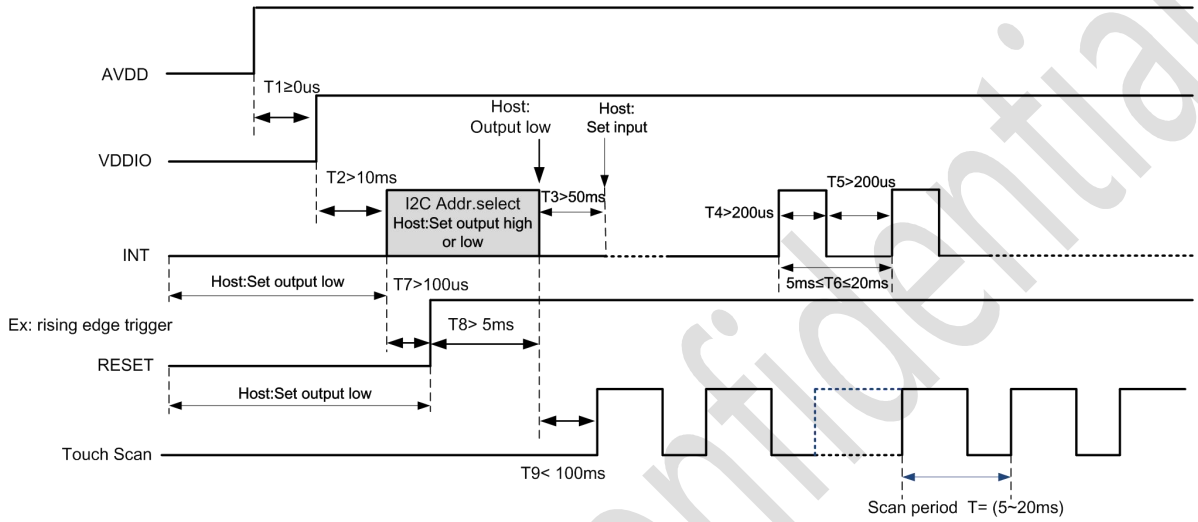
```
#define FREQ_CRC_SEED    0x1021
//calculate the CRC16 value of the data in SrcData (the quantity of data equals to the value
  of Length)
unsigned short    Crc16(unsigned char *SrcData,unsigned char length)
{
    unsigned short    crc=0xFFFF;
    unsigned char    i,j;
    unsigned char    value;
    bit flag;
    bit c15;

    for (i= 0; i < length; i++)
    {
     value=SrcData[i];
     for (j= 0; j < 8; j++)
     {
        flag = (value & 0x80);
        c15 = (crc & 0x8000);
        value <<= 1;
        crc <<= 1;
        if(c15^flag)
        crc ^= FREQ_CRC_SEED;
     }
  }
  return crc;
}
```

4. Power-on Initialization and Modification on Register Value

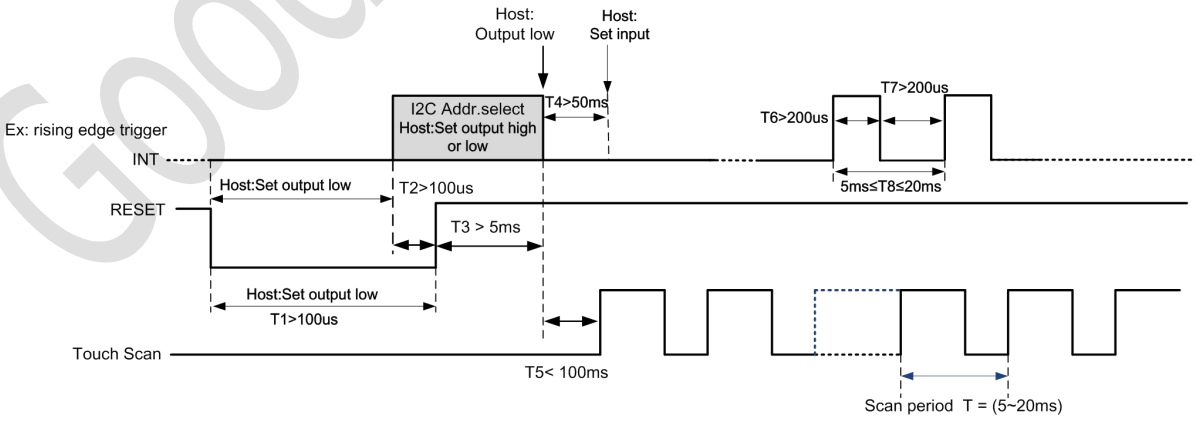
4.1 Power-On Timing of GT911

After power-on, the host needs to control such GT911 pins as AVDD, VDDIO, INT and Reset according to the timing sequence shown below:



Whether host outputs high or low after INT T2 depends on which I²C slave address the host employs to communicate with GT911. If the address is 0x28/0x29, host outputs high; if the address is 0xBA/0xBB, host outputs low.

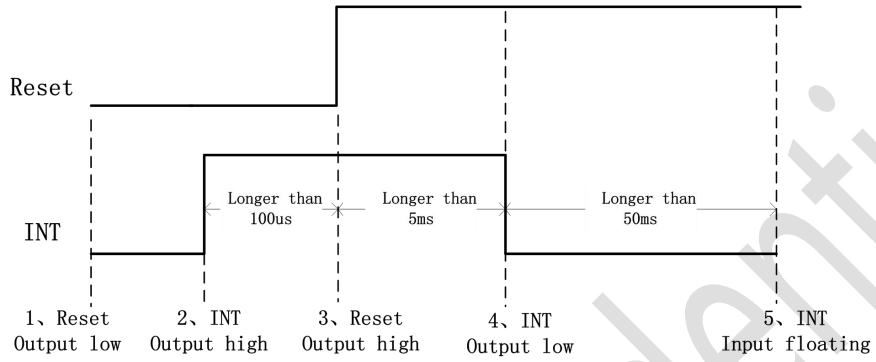
Timing for host resetting GT911:



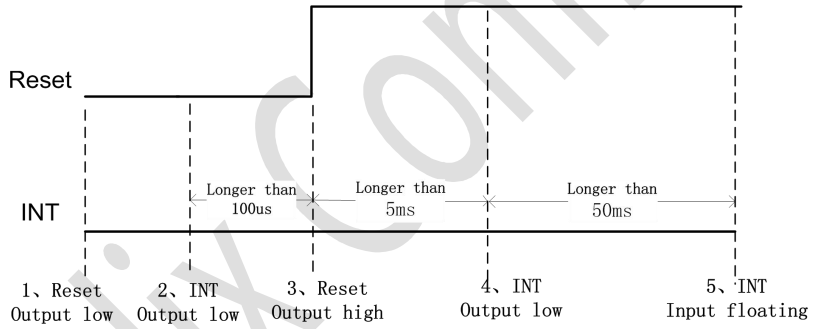
4.2 I²C address selection during power-on or reset process

GT911 supports two I²C slave device addresses: 0xBA/0xBB and 0x28/0x29. Host needs to select the I²C slave address during power-on initialization or Reset process (via Reset pin). Host can select the I²C address by controlling Reset and INT timing sequence. Diagram below provides details:

Timing sequence for setting address to 0x28/0x29:



Timing sequence for setting address to 0xBA/0xBB:



4.3 Send Configuration after Power-on

During the power-on process, after host sets its INT as floating input, it is required to wait for 50ms before sending configuration.

4.4 Register Value Modification

GT911 supports Register Value Modification. When modifying any register in the configuration area (0x8047－0x80FE) based on the timing sequence as specified in section 2, it is required to update Config_Chksum (0x80FF) and set Config_Fresh (0x8100) to 1 in the end. Otherwise, the modification is invalid; when modifying any registers outside configuration area, it is unnecessary to modify Config_Chksum and Config_Fresh.

5. Coordinates Reading

The host reads coordinates by periodic polling or interrupt request.

When periodic polling is adopted, the host reads coordinates through the following steps:

1) Based on the time sequence specified in section 2, the host first reads register 0x814E. If the data in buffer is ready (butter status: 1), it reads coordinate and touch key information based on finger touch number and touch key status.
2) If it is found out in step 1 that data in buffer is not ready (buffer status: 0), it will read again 1ms later.

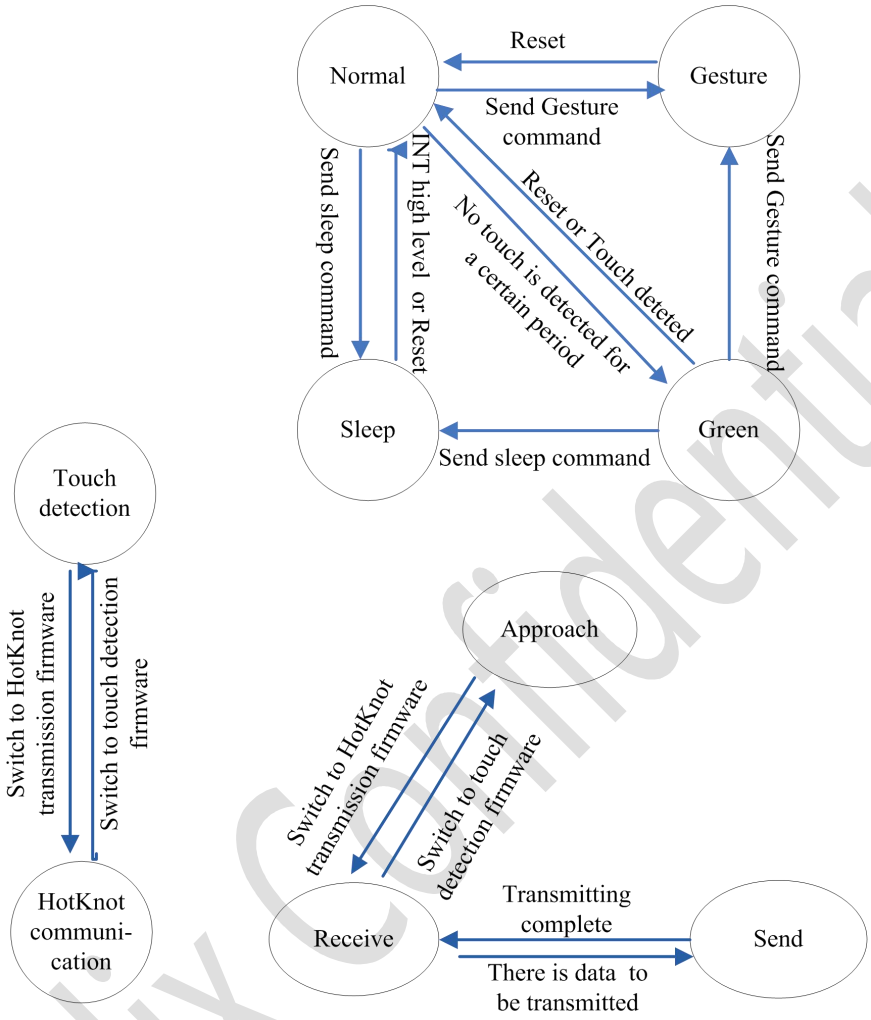
When interrupt request is used for reading, the host will read coordinates through the above polling procedure after interrupt is triggered.

The timing sequence for GT911 interrupt signal output (take the rising-edge triggered interrupt for example. The timing for falling-edge triggered interrupt is similar):

1) In standby mode, INT outputs low.
2) INT is driven from low to high when any coordinate is updated.
3) After the rising edge in step 2, INT will remain high until next period (the period is configurable by setting Refresh_Rate). The host is supposed to finish the reading within one period and reset buffer status (0x814E) to 0.
4) After the rising-edge in step 2, if the host fails to finish reading coordinates within one period, GT911 will output an INT pulse again instead of update coordinates even if it detects new coordinate.
5) If the host still fails to read coordinate, GT911 will keep outputting INT pulse.

6. Operating Modes

6.1 Operating Modes



GT911 can switch between Normal mode and Low Power mode automatically by default. When touch is pressing down or after touch is released for a certain period (0s ~ 15s, configurable), GT911 operates in Normal mode. If no touch is detected within that period, GT911 enters Low Power mode (low-speed scan).

a) Normal Mode

When GT911 is operating in Normal mode, its fastest coordinates refreshing cycle is 5ms-20ms (subject to configuration. One step is 1ms).

When no touch is detected for a certain period (0s~15s, subject to configuration; one step is 1s) in Normal mode, GT911 will enter Green mode to reduce power consumption.

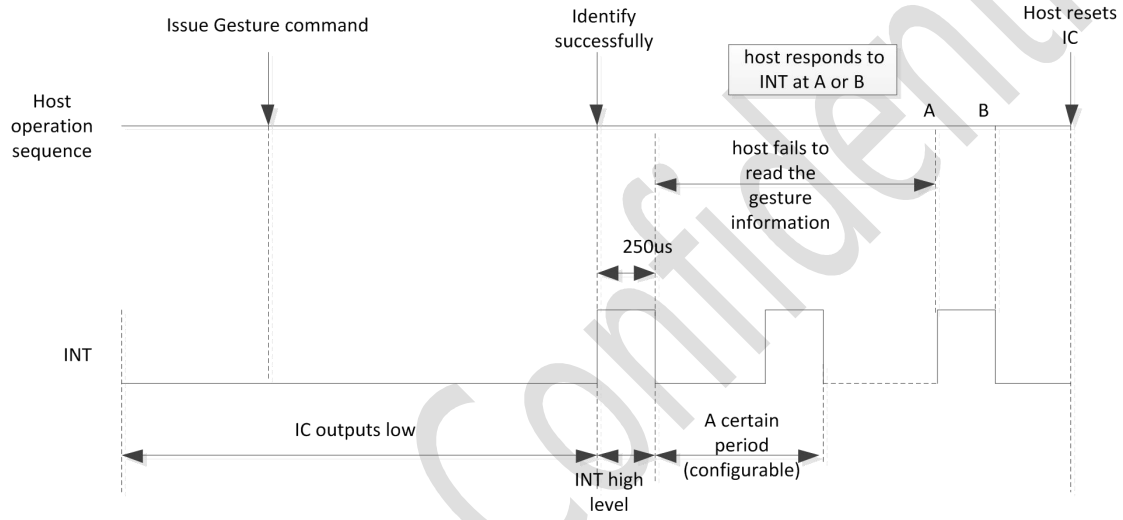
b) Green (Low Power) mode

In Green mode, the scanning cycle for GT911 is about 40ms. It automatically enters Normal mode if any touch is detected.

c) Gesture mode

After the host enables GT911 to enter Gesture mode by sending I²C command 8 to 0x8046, then to 0x8040, wake-up can be achieved by swipe, double-tap, or writing specified letters on touch screen.

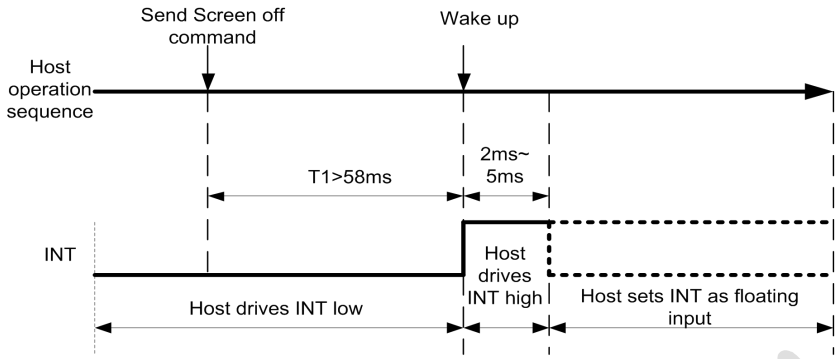
In Gesture mode, when GT911 detects any finger swipe (for a sufficiently long distance), double-tap or writing of specified letters on touch screen, INT will output a pulse for longer than 250us or output high level. The host wakes up and turns on the screen after receiving such high level or pulse.



d) Sleep mode and wakeup

The host enables GT911 to enter Sleep mode by sending I²C command 0x05 to 0x8040 (requires INT to output low before the command). GT911 needs to exits Sleep mode, the host can employ INT high-level wakeup or reset wakeup. If the host employs INT high-level wakeup, the operation sequence is: host drives INT output high for 2ms~5ms, and then drives INT input floating. GT911 enters Normal mode after being woken up and it will output a touch-release pulse in every cycle. The host must read the interrupts of three cycles. Otherwise, GT911 will not stop outputting such pulse. The time interval between issuing the screen-off command and wakeup should be longer than 58ms. If the host employs reset wakeup, it is required to control the INT pin and Reset pin during the power-on initialization as mentioned in section 4.1.

Timing for INT high-level wakeup:



e) Approach Mode

When the HotKnot function is enabled, GT911 is operating in Approach Mode. If GT911 exits Approach Mode, the host can send command 0x20 or 0x21 to enable GT911 to enter Approach mode again. In this mode, touch detection and HotKnot proximity detection alternate. If the host sends 0x21 to GT911, GT911 will work as a transmitting terminal and transmit signals with a specified pattern and frequency via driving and sensing channels. Then, GT911 detects whether there are feedback signals with the same specified pattern and frequency from the receiving terminal. This helps to determine whether any receiving terminal exists. If the host sends 0x20 to GT911, GT911 will work as a receiving terminal and detect signals with a specified pattern and frequency from the transmitting terminal. If such a signal is detected, GT911 responds using signals with the specified pattern and frequency to the transmitting terminal. In Approach mode, when detecting any communicable terminal within the near-field range, GT911 will notify the host via INT to capture status. To ensure reliable detection between the transmitting terminal and the receiving terminal, it is required to keep detecting for a minimum of 150ms after the two terminals have detected each other. Then the host sends HotKnot transmission firmware to enable GT911 to enter Receive mode.

f) Receive Mode

When GT911 operates in Approach mode, after notified that GT911 has successfully detected another HotKnot terminal, the host sends HotKnot transmission firmware to enable GT911 to enter Receive mode. In Receive mode, GT911 continues to detect frame start signal, once the signal is detected, GT911 begins to detect and receive data. When the receiving process is complete, GT911 verifies the data. If GT911 finds erroneous data, the receiving process begins again. If the data is found to be correct, GT911 notifies the host via INT to read data in the Receive Buffer.

g) Send Mode

When GT911 works in Receive mode, the host sends outgoing data to the Transmit Buffer. When detecting that the Transmit Buffer is refreshed and there is data to be sent, GT911 automatically switches from Receive mode to Send mode. In Send mode, GT911 sends a frame start signal. If it detects ACK fed back from the receiving terminal, it continues to send the data signal. After sending a data chunk, GT911 begins to detect ACK. If it does not detect any ACK or if it detects an erroneous ACK, GT911 will resend the data chunk. If this resending fails over 5 times, it will resend the current data frame another time to the receiving terminal until the host enables GT911 to exit Send mode due to timeout. If GT911 detects ACK and sends the data successfully, it will automatically switch to Receive mode after the host completes the data processing or due to timeout.

7. Host System Driver Modification in Gesture Mode

7.1 Enter Gesture mode after screen-off

a) If screen-off is achieved by pressing Power key (or any other key), send Command 8 to 0x8046, then to 0x8040;

b) If screen-off is achieved due to timeout, send Command 8 to 0x8046, then to 0x8040;

c) When the screen is off, if there is slide, double-tap or writing of specified letters on TP, the INT pin will output a high level or a pulse that is greater than 250us to notify the host. The host reads the value of 0x814B after receiving such pulse. If the value meets wake-up conditions, the host wakes up, then resets GT911 and turns on the screen. Otherwise, the host resets 0x814B and waits for the next pulse or high level.

7.2 Enter Sleep Mode after screen-off

a) If screen-off is achieved by pressing Power key (or any other key), send Command 5 to 0x8040 ;

b) If screen-off is achieved due to timeout, send Command 5 to 0x8040 ;

c) In Sleep mode, host can be awakened only by pressing Power key (or Home key).

7.3 Press Power (or Home) key to wake up host

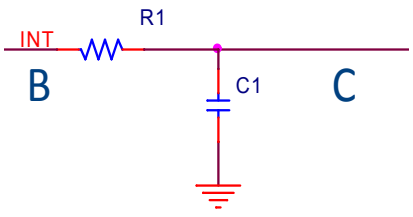
In any modes, if awakened by pressing power key (or Home key), the host will reset GT911 based on reset timing sequence and implement reset process.

7.4 Recommended to apply in conjunction with IR

If gesture wake-up function is applied in conjunction with IR, the host can enable GT911 to enter Sleep mode to reduce power consumption when IR detects shielding object while screen-off. Otherwise, GT911 enters Gesture mode. To enter different modes, use the methods listed above (reset is required before sending command).

7.5 Hardware circuit modification

When tuning, connect RC circuit to INT pin in series (R: 680Ω, C: 1nF) as shown below:



Connect B to GT911 INT and C to host INT; pull-up resistor cannot be connected to host INT.

8. Reading Coordinate in Gesture Mode

In Gesture mode, when 0x814B is not 0, the host can acquire the wakeup trajectory of user by reading the gesture features and gesture coordinates.

Gesture features: the host reads registers ranged from 0x814D to 0x816C and captures the following Gesture features: start coordinate, end coordinate, trajectory width, trajectory height, trajectory central frequency and the four extreme points of the trajectory. The host can sketch wakeup trajectory of user by these features and the gesture type indicated by 0x814B.

Gesture coordinates: the host obtains the number of touch points of the trajectory by reading the register 0x814C. And then it reads the registers ranged from 0x9420 to 0x951F based on the principle that every four register correspond to one touch point. Finally, the host can acquire the accurate touch trajectory of user by synthesizing the above information.

9. Time Limit for Transmitting HotKnot Firmware

In HotKnot mode, in order to ensure the I^2C transmission rate and considering factors such as time expended by system calls and user experience, the time limit for transmitting HotKnot firmware should be within 800ms, that is to say, the I^2C transmission rate should be no less than 200Kbps. FAEs should make sure this requirement is fulfilled when debugging for customers.

Since HotKnot may employ the frequencies such as 200K, 250K, 300K, 350K, 400K, 450K, etc., in order to avoid interference caused by trace routing, it is recommended that the I^2C transmission rate should be different from the above frequencies, with a deviation greater than 10 KHz, for example, 325 KHz.

10. Revision History

Revision	Date	Description
Rev 01		Initial release
Rev 02	2012-9-24	Updated configuration; Deleted description on frequency hopping
Rev 03	2012-10-8	Modified some description
Rev 04	2012-10-23	1. Added power-on timing; 2. Added description on the timing of wakeup through INT and Reset; 3. Modified description on high-level wakeup
Rev 05	2013-1-16	Updated description on register map
Rev 06	2013-6-14	1. Updated register map; 2. Modified description on sleep mode; 3. Added wakeup timing diagram
Rev 07	2013-8-27	1. Updated register map; 2. Updated power-on timing; 3. Modified description on sleep mode
Rev 08	2014-8-4	1. Updated register map; 2. Added description on gesture and HotKnot registers; 3. Updated power-on timing; 4. Added reset timing; 5. Modified IIC address selection timing; 6. Modified description on operating modes; 7. Added description on Gesture mode driver modification; 8. Added description on Gesture mode coordinate reading; 9. Added description on time limit on HotKnot FW download; 10. Updated power-on and reset timing diagrams
Rev 09	2016-06-01	Modified description on the registers 0x807D, 0x807F, 0x80A6, 0x80A7 and 0x80A8.
Rev 10	2017-07-26	Updated Coordinate Information Registers
